# Operating systems

Sheet 9
(EED)

Name: Samuel Ayman Shawky

ID: 20010750

## **Q1**)

**a-** Split binary address into virtual page number and offset; use virtual page number as index into page table; extract page frame number; concatenate offset to get physical memory address.

#### b-

$$(i)1052 = 1024 + 28$$

So virtual page number=1 & page frame number=7

Physical address=7\*1024+28

(ii) 
$$2221 = 2 \times 1024 + 173$$

So virtual page number=2

Page fault

(iii) 
$$5499 = 5 \times 1024 + 379$$

So virtual page number=5 & page frame number=0

Physical address=0\*1024+379

### **Q2**)

#### **a-**4MB

**b-**Number of rows:  $2^6x2=128$  entries. Each entry consists of: 20 (page number) + 20 (frame number) + 8 bits (chain index) = 48 bits = 6 bytes. Total:  $128 \times 6 = 768$  bytes

# **Q3**)

#### a-

$$2^{32}/2^{10} = 2^{22}$$
 pages,

so 22 bits needed to specify a page in virtual memory.

Each page table contains  $(2^{10} \text{ bytes per page table})/(4 \text{ bytes/entry}) = 2^8$  entries. each page table can handle 8 of the required 22 bits. Therefore, 3 levels of page tables are needed.

**b-** 
$$(8 + 8 + 6 = 22)$$
.

**c-**Less space is consumed if the top level has  $2^6$  entries. In this case pages =  $1 + 2^6 + 2^{14} = 16,449$  pages. If the middle level has  $2^6$  entries, then pages is  $1 + 2^8 + 2^{14} = 16,641$  pages. If the bottom level has  $2^6$  entries, then the number of tables is  $1 + 2^8 + 2^{16}$  pages = 65,973 pages.

### **Q4**)

$$2^{64}/2^{12} = 2^{52}$$
 entries

Entries per page=4kbyte/4byte=1kbyte=2<sup>10</sup>

It will be 6 levels.

$$(2+10+10+10+10+10)$$

#### **Q5**)

a-

8x2=16kbyte

b-

4x16=64kbyte

c-

$$2^{32}/2^{11}=2^{21}$$

#### 0000 0000

0000 0010 00011

#### 010 1011 1100

| Page number(2) | Segment(3)    | Offset(11)    |
|----------------|---------------|---------------|
| •              | <b>— 21 —</b> | <b>←</b> 11 → |

 $2^{32} = 4$  GBytes.

### **Q6)**

**a-** page number take 5 bits( $32 = 2^5$ page)

offset take 11 bits $(2k = 2^{11})$ 

| Page number(5) | Offset(11) |
|----------------|------------|
|----------------|------------|

#### b-

length equal number of pages =32

width equal number of bits needed to represent physical memory.

1Mbyte/2Kbyte=512=29

Width = 9 bits

#### c-

if the physical memory space is reduced by half the length of page table stays the same =32.

the width will change to equal 8bits.

**Q7**)

a-

In paged system we need two memory access one to access page table and get frame number and the other to access data so access time =2\*200=400ns

#### b-

EMAT = 0.85 \* 220 ns + 0.15 \* 420 ns = 187 ns + 63 ns = 250 ns.

**Q8**)

#### a-FIFO
